1 Introduction

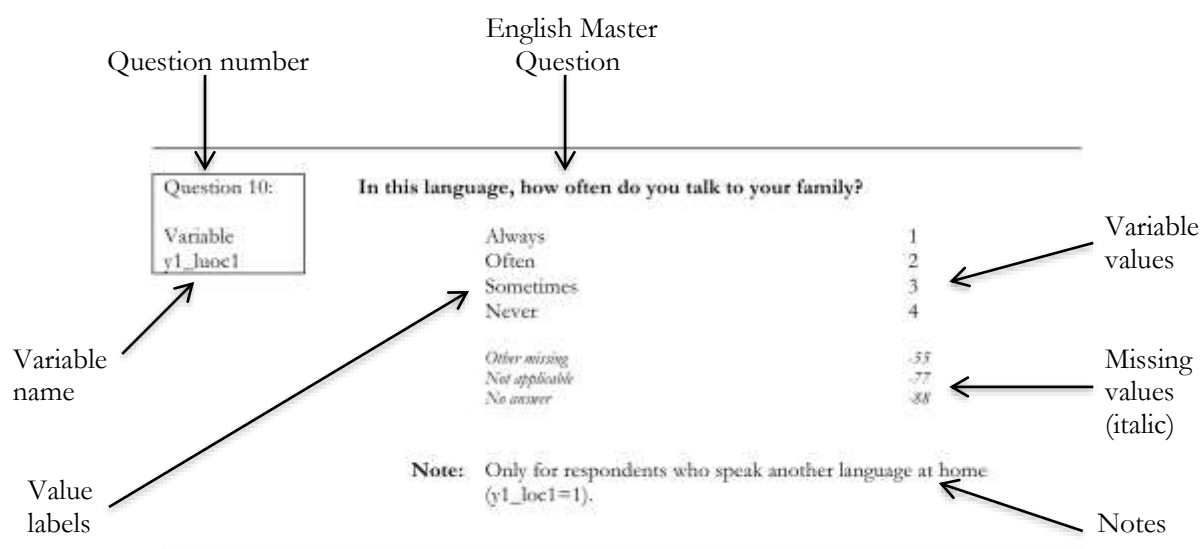

This codebook offers a complete documentation of data collected in the Corona Survey of the “Children of Immigrants Longitudinal Survey in Four European Countries - Germany” (CILS4EU-DE). An overview of the different data sets is given in the table below. The data sets can be merged using the unique identifier variable `youthid`.

Germany		
Part	Version	
Youth main	Full	wc1_ym_ge_v6.0.0.dta
	Reduced	wc1_ym_ge_v6.0.0_rv.dta

For each data set, a reduced version and a full version exist. A comparison between these two versions can be found in Appendix B.

The structure of the codebook is oriented to the data structure, including separate subsections for the different data sets.

Section 2 provides an overview of all variables: ordered by topic (section 2.1) and ordered according to how they appear in the data set (section 2.2). By clicking on the page number on the right-hand side in the digital version, information about this variable can be retrieved:

Negative values indicate different types of missing values:

Code	Label	Description
-88	No answer	No box ticked/no answer given
-77	Not applicable	Not answered due to filter question
-66	Question not asked	Not asked in a country/mode
-55	Other missing	Answers that could not be coded, fun answers
-44	Interrupted interview	Only for telephone and online modes (only in web and telephone mode)
-33	Not available in reduced version	Answers not available in the download version

Notes contain further specificities for the respective variables. In general, the following information can be found in the notes:

- Question was not asked in one or more modes.
- Question was not asked due to filter question.
- Further variables closely related to the variable.
- Variable is not included in the reduced version of the data set.
- Multiple answers are possible.

In general, all variables reflect questions included in the questionnaires. However, in some cases, coarsening was necessary to make the variable suitable for the download version of the data. These reduced-version variables can be identified by their variable name ending with RV. For instance, information on the language other than German in which respondents obtain information about the Corona pandemic `yc1_medloc2a` is not available in the reduced version of the data. Instead, we offer a reduced version of this variable `yc1_medloc2aRV`, which contains languages with at least 6 mentions in the survey. This variable is also included in the full version of the data.

4.2 Appendix B: Differences Between Full-Version and Reduced-Version

Due to data security reasons, two different versions are available for each data set: (1) a version with complete information collected during the survey (full version) and (2) a version in which specific information was reduced and aggregated in order to prevent the identification of single respondents (reduced version).

The structure of the full version and the reduced version of the data set is identical. This means that in both versions the same variables are included, but the variables encompass different information depending on the version of the data set. Variables with reduced or aggregated information are marked with an “RV” at the end of the variable name.

In the following overview, the differences between the full version and the reduced version of the data are listed.
